Good morning My dear sirs and fellow friends. Thank you for being here today. I am saminda lakshan. and I am delighted to present to you the software system I developed for a small shoe showroom which located in Millawitiya.

So, when I gathering the requirement from the owner his primary need was, he needed a billing system to issue a invoice when he sells his items. therefore main task of this system is to generate a bill.

Let's take a closer look at the system.

When you open this system this interface comes first, where you have to enter the user name and password. There are main three types of accounts in this software. Which are Admin, cashier and the Storekeepr. Lets begin by log in to the store keeper account. As you can see some of buttons and functions are grayed out for the storekeeper. Storekeeper can only access

to the store update functions only. So, we can go to the store update section and add shoes like this.

Now lets log in to the cashier account. Cashier account provides access to almost all functions in the system. Cashier can add new customers to the database and add orders.

By using this section you can add customers to the database. It opens like this interface and you can navigate the customer details already in the database by clicking these buttons. If you want to add a new customer you can click add new and enter the details. After that you can save it. If you want to delete a customer you can search the customer by their telephone number and delete it.

So let's go to create a invoice. For that you have go to the new order. Then you get this interface. Firstly, you have to enter the customers phone

number. When you started entering numbers the system starts to suggest the numbers which are in the database. If the number is available you can select from here or you can enter the number. You cannot type any letters or special characters here if you do system will shows a message like this and it will remove that letter without asking. When the number has 10 digits and if it is not in the database it asks to save the number. Then you can save it by giving the name and the address.

Then you must enter the design id after that it shows the sizes of the shoes in that design. You can select the size and press enter then it asks the quantity. You have to type the quantity in the text box. Then it will add to the invoice like this. By that way you can add as much as items you needed to the bill. If you want to remove or edit item these buttons will do that for you. Then you must enter the payment to this textbox.

Then click the print it will show the print preview. In this bill you can see the things like items, date of order likewise.

If you want to see the orders and details you can click this button and see them using the navigation buttons. Also you can search by invoice number.

By using this menu you can access the customer list, order history and store report

Okay so if you have any question, please feel free to ask.

Well, I believe that covers everything. Once again I would like to express my gratitude for giving me the opportunity to speak to you today. Thank you
